

For each of these scenarios decide if you could use supervised or unsupervised techniques, or both!

1. Define the likelihood that an individual will contract a specific disease
 - i. Supervised
2. Translate a set of images into variables for modeling
 - i. unsupervised
3. An ecommerce company wants to identify power users
 - i. Both
4. That same company wants to see shopping patterns in users
 - i. unsupervised
5. You want to reduce the number of variables inputting into your random forest model
 - i. unsupervised
